Version 1.0 25th September 2015

Lamp Getter Movement

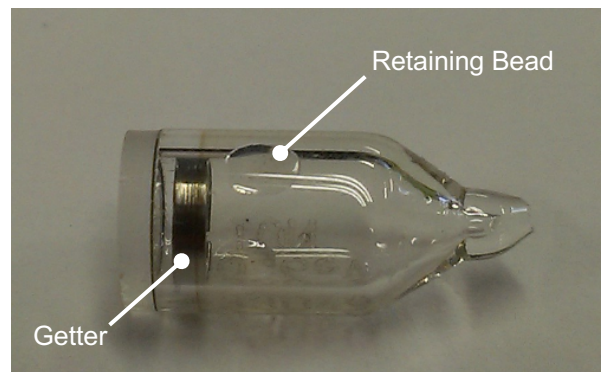

As an ongoing commitment to produce high quality products, Ion Science has made an improvement to its lamp manufacturing process.

This change ensures that the metallic band within the lamp named the 'getter' remains stationary throughout its life.

Previously it had been noted from customers that the getter could move up and down the length of the lamp. Although testing showed no deleterious effect we listened to the concerns raised and acted accordingly.

The new lamp can be recognized by two transparent beads of glass within the interior of the lamp (see accompanying photo).
